

Project Executable Files

Date	15 March 2026
Team ID	XXXXXX
Project Name	Credit Card Approval Prediction
Maximum Marks	3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	Yes
8	Dockerfile / Containerization config (if applicable)	Yes
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
Credit-Card-Approval-Prediction/
|
|-- app.py                - Flask application (routes, model loading, feature
encoding)                  encoding)
|-- model.pkl              - Trained/placeholder ML model loaded at runtime
|-- model_placeholder.py   - Script to generate a placeholder model.pkl for testing
|-- requirements.txt       - Python dependencies
|-- README.md              - Project overview, setup, and usage documentation
|
|-- static/
|   |-- css/style.css      - Custom FinTech design system
|   |-- js/script.js       - Client-side animations, counters, form validation
|   |-- images/            - Static image assets
|
|-- templates/
|   |-- base.html          - Jinja2 base template (navbar + footer)
|   |-- home.html          - Landing page (hero, features, statistics)
```

-- about.html	- About page (objectives, workflow, tech stack)
-- index.html	- Prediction form (13 input fields)
-- result.html	- Result page (approved/rejected card)

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	http://127.0.0.1:5000/
Login Credentials (Demo)	Not required — the application has no authentication layer in the current version; the prediction form is open access
Platform / Hosting Provider	Local Flask development server (Gunicorn-ready for production); IBM Watson Machine Learning for cloud deployment
Repository Link	https://github.com/Zaamir05/Credit-Card-Approval-System
Demo Video Link	https://drive.google.com/file/d/11AL1Pm76_l-0QIN1YBtgfhKvJyMCOWFW/view?usp=drivesdk

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites:

Python 3.10 or higher, pip

Step 1: Clone the repository

```
git clone https://github.com/yourusername/Credit-Card-Approval-Prediction.git
cd Credit-Card-Approval-Prediction
```

Step 2: Create and activate a virtual environment

```
python -m venv venv
venv\Scripts\activate      (Windows)
source venv/bin/activate   (macOS / Linux)
```

Step 3: Install dependencies

```
pip install -r requirements.txt
```

Step 4: Generate a placeholder model (optional, if model.pkl is not yet trained)

```
python model_placeholder.py
```

Step 5: Run the Flask application

```
python app.py
```

Step 6: Open a browser at

```
http://localhost:5000
```

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	The included model.pkl is a placeholder trained on random dummy data (via model_placeholder.py), not the final trained model	Replace model.pkl with the actual trained Random Forest/XGBoost model before production use, as noted in the README
2	No authentication layer on the prediction routes	Planned future enhancement: JWT-based authentication to secure the prediction API
3	Predictions are not persisted to a database — results only exist in the session	Planned future enhancement: database logging of prediction history (SQLite/PostgreSQL)
